

Cybersecurity in health care and why it is important for all of us

The digitalization of health care systems is changing the everyday work-life of many if not all professions in the healthcare system. As a direct consequence of handling sensitive patient data in electronic form, healthcare institutions have become a primary target for cyberattacks and are known to be an easy target for malicious actors. In our presentation we highlight the background and challenges of cyber security in the healthcare system and what that means for all professionals working in this sector. We will lay out the direct relationship between cyber security and sustainable health and the positive contribution every professional regardless of their formal qualification or role can take.
